

ABSTRACT

A conductive polyaniline composition capable of producing a molded article possessing high conductivity, and
5 a method for producing a conductive polyaniline composition without producing polyaniline in a non-conductive base state.

The conductive polyaniline composition including a substituted or unsubstituted polyaniline complex (a) and a compound (b) having a phenolic hydroxyl group into the
10 protonated dissolved in the organic solvent substantially immiscible with water; the method for producing the conductive polyaniline composition; and a molded article obtainable by forming the conductive polyaniline composition.
